

Urology Moans, Groans and Kidney Stones

Nick Rukin

Director of Urology Redcliffe Hospital, MN Health

Moans, Groans and Kidney stones

Moans

- Urinary tract infections
- Stent pain
- Testosterone deficiency
- Haematospermia

Groans

- Renal cysts
- Haematuria
- Urine cytology

Recurrent UTIs

Definition: 3 or more uncomplicated UTIs in a 12-month period

- Recurrent UTIs cannot be ignored, as they may be the first sign of urothelial cancer.
- Conversely, asymptomatic bacteriuria should not be over tested or over treated as it is common.

Investigations: MSU, ultrasound renal tract +/- flexible cystoscopy (refer urology)

Recurrent UTIs

Medical Treatment Options:

1. Cranberry tablets: Proanthocyanidins (prevent E.coli attaching to the urinary tract)

2. Post-intercourse antibiotic: Trimethoprim 100mg OD

3. Low dose antibiotics: Trimethoprim 100mg OD
 Nitrofurantoin 50mg OD
 Cephalexin 250mg OD

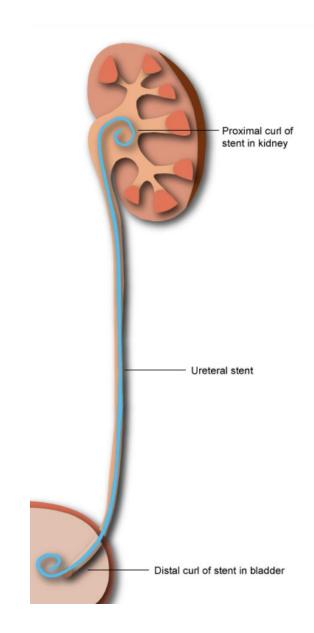

4. Hiprex: one tablet, twice daily (lowers urinary pH + antibacterial activity)

the bmj Visual abs		tibiotic alternatives for treatment ary tract infections (UTIs)			
66 Summary	Methenamine hippurate could be an appropriate non-antibiotic alternative to prophylactic antibiotics for women with recurrent UTIs, informed by patient preferences and antibiotic stewardship				
🖉 Study design	n Randomised Open Recruited women from eight centres across the UK				
iii Population With recurrent UTIs requiring prophylactic treatment Wedian average 6 UTIs in 12 months before trial entry in both groups Peri-/post-menopausal: 59% Average age: 50 years					
4 [™] Comparison	Experimental Methenamine hippurate Taken twice daily for 12 months 120	Antibiotic prophylaxis Nitrofurantoin, trimethoprim, or cefalexin taken daily for 12 months			
Incidence of sympton antibiotic treated UTIs the 12 month treatme	s over g	Absolute difference — in UTI incidence ‡ 90% CI 0.5 1			
Modified intention-to	-treat * 205 1.38	0.89			
Intention-to-treat 240 1.40		0.88			
Per protocol † 170 1.29		0.08			
Per protocol †					
* All participants observed † Participants who achieve	170 1.29 I for ≥ six months				

Stent Pain (24-30cms, 4.8-6Fr)

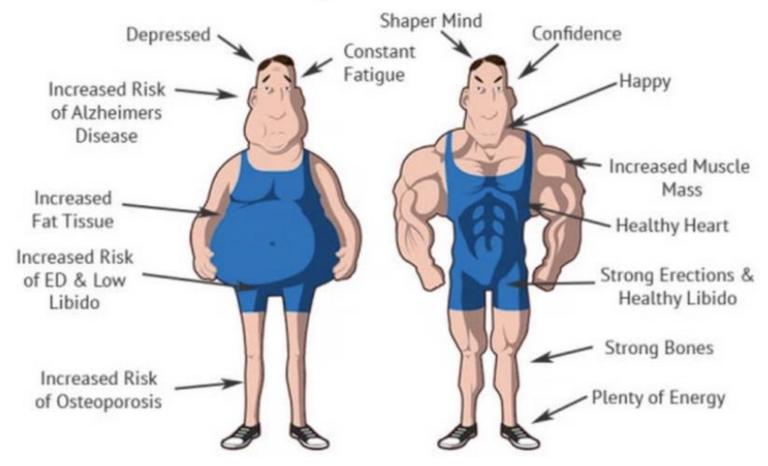

- Pain: 80% patients develop some type of pains afterwards
- Type of stent: Silicone Vs standard co-polymer stent SILICONE superior
- Stent pain treatment:

Remove stent Tamsulosin therapy Oxybutynin/solifenacin

Testosterone Deficiency – Urological Risks

Benefits of Optimal Testosterone

Reminder: 7-11am, fasting state blood test

urology

Urology News @Uro_News • 8h Insight into UK practice: A 66 year old with localised GI 3+4 CaP, PSA <0.01; 1 year post RARP. Lacks energy and low mood; T 7nnmol/L. Would you start #testosterone? @benchallacombe @ChannaJayasena @RogerKirby12 @gordonhmuir

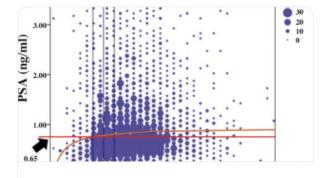

@Dr_Andrology @HussainAlnajjar

@JudeDockray @MajShabbir

* For men on TRT no statistical significant difference in CaP 🔼 vs placebo

* Low T associated with higher-grade CaP

* TRT ≠ îrisk of CaP/severity if diagnosed previously

TRT and Urology

Contra-indications:

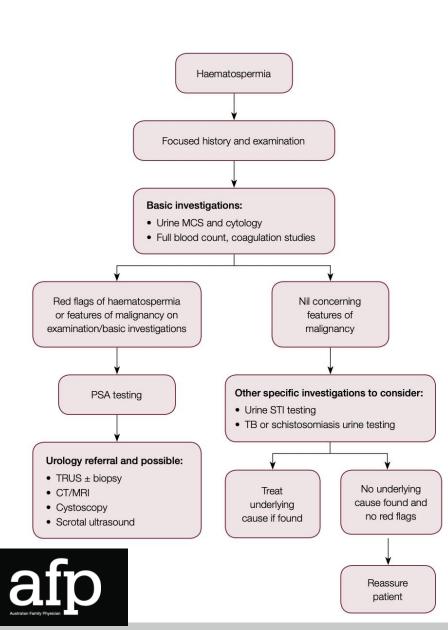

ACTIVE prostate and breast cancer, fertility issues

No effect:

LUTS – NOT detrimental, improves IPSS, may increase prostate size, SEVERE symptoms no data

Prostate cancer: Risk: does not increase risk CaP: low risk patients, Gl<7, PSA<0.01 at 12 months

Haematospermia

RED FLAG

- age>40
- Recurrent or persistent haematospermia
- Prostate cancer risk factors (family Hx, African heritage)
- Constitutional symptoms (weight loss, anorexia, body pain)

		Нає	ematospermia		
		 Travel to areas end Risk of sexually trai Haematuria 	oms ia / frequency e /pelvis pain ostate or testis cancer demic for TB or schistor nsmitted infections nce/excessive ejacul	somiasis	
Single episode No associated symptoms	Persistent episodes or ≥40 years or risk factors for prostate cancer	Examination • Measure BP • Digital rectal examination • Serum blood test – FBC, LFT, clotting			
	•	•	•	•	
Reassurance or TRUS/mpMRI	PSA mpMRI Semen culture	+ Abnormal testis examination or testis cancer risk factors	+ Visible haematuria	+ Symptoms of UTI Risk of STIs	+ Risk of infectious disease
		+			
		USS testis	CT urogram Flexible cystoscopy	Urine culture Flexible cystoscopy Semen culture/ STI screen	Semen culture Viral serology Mycobacterial culture

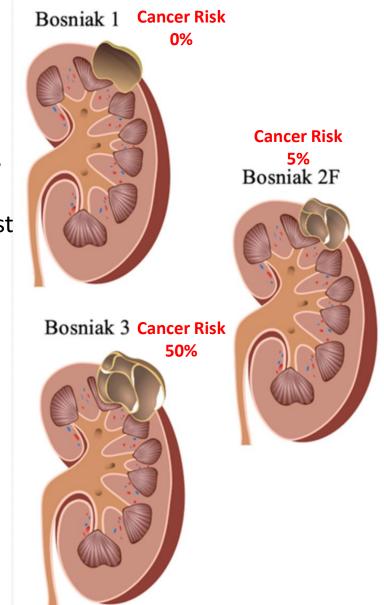

Renal Cysts

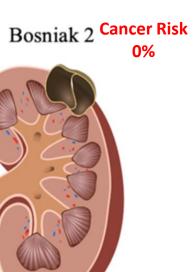

Simple Vs Benign Cysts – 50% over 50s have simple cysts

Renal CT with contract is *Gold Standard* to define the cyst

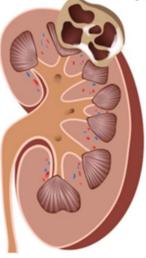

Cysts type define follow-up:

- Bosniak 1 and 2 cysts no follow up
- Bosniak 2F FU up to 5 years
- Bosniak 3 and 4 cysts likely malignancy

Bosniak 4 Cancer Risk 90%

Haematuria – Fast facts

Visible haematuria (VH) – 20% cancer detection

Non-visible haematuria (NVH) - 5% cancer detection

MSU - exclude infective, RCC count

Cytology x3

CT urogram (USS renal tract - NVH)

Cystoscopy – Flexible or rigid

Urine Cytology

- Not a morning urine sample as increased cytolysis.
- 25mls, 3 separate days
- Sensitivity: HG/CIS >85%, LG 16%

The Paris System - 2016					
No adequate diagnosis possible	No diagnosis				
Negative for urothelial carcinoma	Negative				
Atypical urothelial cells (Atypia)	Atypia				
Suspicious for HG urothelial cancer	Suspicious				
High grade/G3 Urothelial cancer	Malignant				

- Atypia: FU as 21% progress to positive cytology/surgical pathology, mean progression 155 days
- Suspicious: FU 40% develop cancer (urothelial or prostate), mean duration 173 days. ALL had persistent suspicious cytology or persistent haematuria

Kidney Stones

- Risk: Lifetime risk 1 in 11, often incidental finding.
- Symptoms: Renal colic, UTIs, haematuria or asymptomatic.
- Investigations: Renal function, urate/calcium, MSU
- Radiology: CT KUB 'Gold Standard', smaller stones can be missed on ultrasound/X-ray KUB
- Pain control: *BEST* option is NSAIDs oral or PR (diclofenac/indomethacin)
- Ureteric stone: Approx. 50-60% chance of spontaneous passage URGENT referral if a stone is in the ureter

Acute Stone Treatment

- 1. Presence of infection with urinary tract obstruction (Urosepsis)
- 2. Bilateral obstructing stones
- 3. Intractable pain or vomiting, or both
- 4. Acute kidney injury
- 5. Obstruction in solitary/transplanted kidney
- 6. Work related reason, e.g. pilot/submariner

Review

Asymptomatic Kidney Stones

Natural history of small asymptomatic kidney and residual stones over a long-term follow-up: systematic review over 25 years

Catherine E. Lovegrove^{1,2} (b), Robert M. Geraghty^{3,4} (b), Bingyuan Yang¹, Eleanor Brain⁵, Sarah Howles^{1,2,6} (b), Ben Turney^{1,2} and Bhaskar Somani⁷ (c)

What do you do with an incidental, asymptomatic renal stone on imaging?

- Risk of becoming symptomatic over 2-year period: up to 59%
- Risk of needing surgical intervention over a 3-year period: up to 35%
- Risk of emergency admission over a 4-year period: up to 20%

Suggest: Referral for discussion of management options, follow-up, and future stone prevention options

Prevention of Kidney Stones

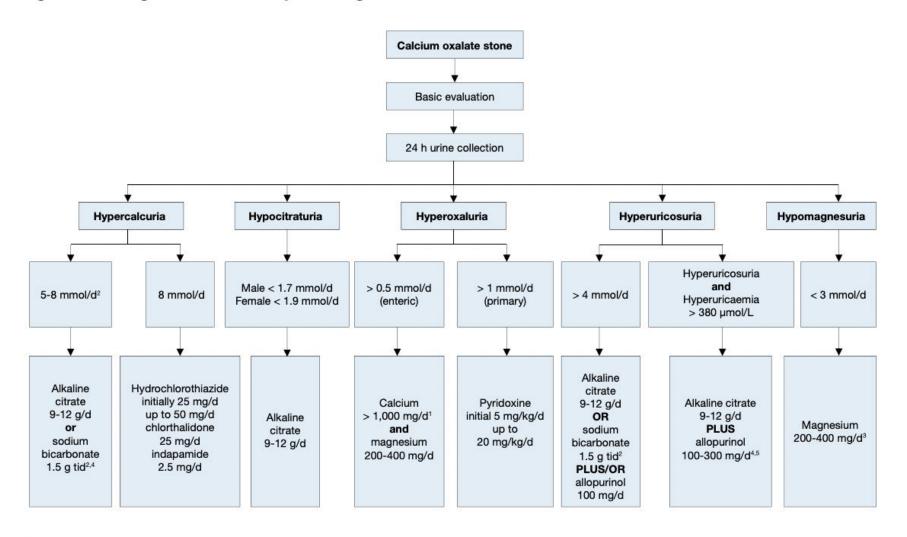

50% of patients will have 2nd episode within 10 years

General advice: Fluid intake 2.5-3.0 L/day Balanced diet: High fibre/vegetables Low salt/animal protein Physical activity/normal BMI

Metabolic evaluation: High risk stone formers

Figure 4.2: Diagnostic and therapeutic algorithm for calcium oxalate stones

- ¹ Be aware of excess calcium excretion.
- 2 tid = three times/day (24h).
- ³ No magnesium therapy for patients with renal insufficiency.
- ⁴ There is no evidence that combination therapy (thiazide + citrate) or (thiazide + allopurinol) is superior to thiazide therapy alone [511, 518].
- ⁵ Febuxostat 80 mg/d.

Moans, Groans and Kidney stones

Moans

- Urinary tract infections
- Stent pain
- Testosterone deficiency
- Haematospermia

Groans

- Renal cysts
- Haematuria
- Urine cytology
