Metabolic dysfunction- associated fatty liver disease (MAFLD)

Dr Marnie Wood
Gastroenterologist & Hepatologist | RBWH

Dr Marnie Wood FRACP PhD

Gastroenterologist/Hepatologist RBWH

25th October 2025

~~MAFLD~~

MASLD

Plan

- Solid understanding of the disease
- How to assess
- Who to refer
- How to manage
- What is coming

“What's in a name? That which we call a rose
By any other name would smell as sweet”

W. Shakespeare 1597

➤ The evolution of the nomenclature for NAFLD, MAFLD and MASLD

“What's in a name? That which we call a rose
By any other name would smell as sweet”

W. Shakespeare 1597

➤ The evolution of the nomenclature for NAFLD, MAFLD and MASLD

Expanding the spectrum of non-alcoholic steatohepatitis (NASH) to encompass non-alcoholic fatty liver (NAFL), commonly referred to as non-alcoholic fatty liver disease (NAFLD).

Says what it isn't, hard to describe with alcohol cofactor

★ A consensus group of 31 global experts in NAFLD suggested renaming NAFLD to metabolic dysfunction-associated fatty liver disease (MAFLD).

2020

1980

2006

2023

Around 1980, liver biopsies of certain hepatitis patients revealed pathological changes resembling those of alcoholic hepatitis, which led to the establishment of the term non-alcoholic steatohepatitis (NASH).

This standard was utilized in the diagnosis and treatment guidelines for NAFLD and is integrated into the International Classification of Diseases (ICD-10).

★ The multi-society consensus on the new nomenclature for fatty liver disease was published, suggesting renaming NAFLD to “metabolic dysfunction-associated steatotic liver disease (MASLD).

★ In the development of NAFLD, MASLD accentuates metabolic cardiovascular risk factors more prominently than MAFLD

“What's in a name? That which we call a rose
By any other name would smell as sweet”

W. Shakespeare 1597

➤ The evolution of the nomenclature for NAFLD, MAFLD and MASLD

Author Information 

Hepatology 79(5):p 1212-1219, May 2024. | DOI: 10.1097/HEP.0000000000000670

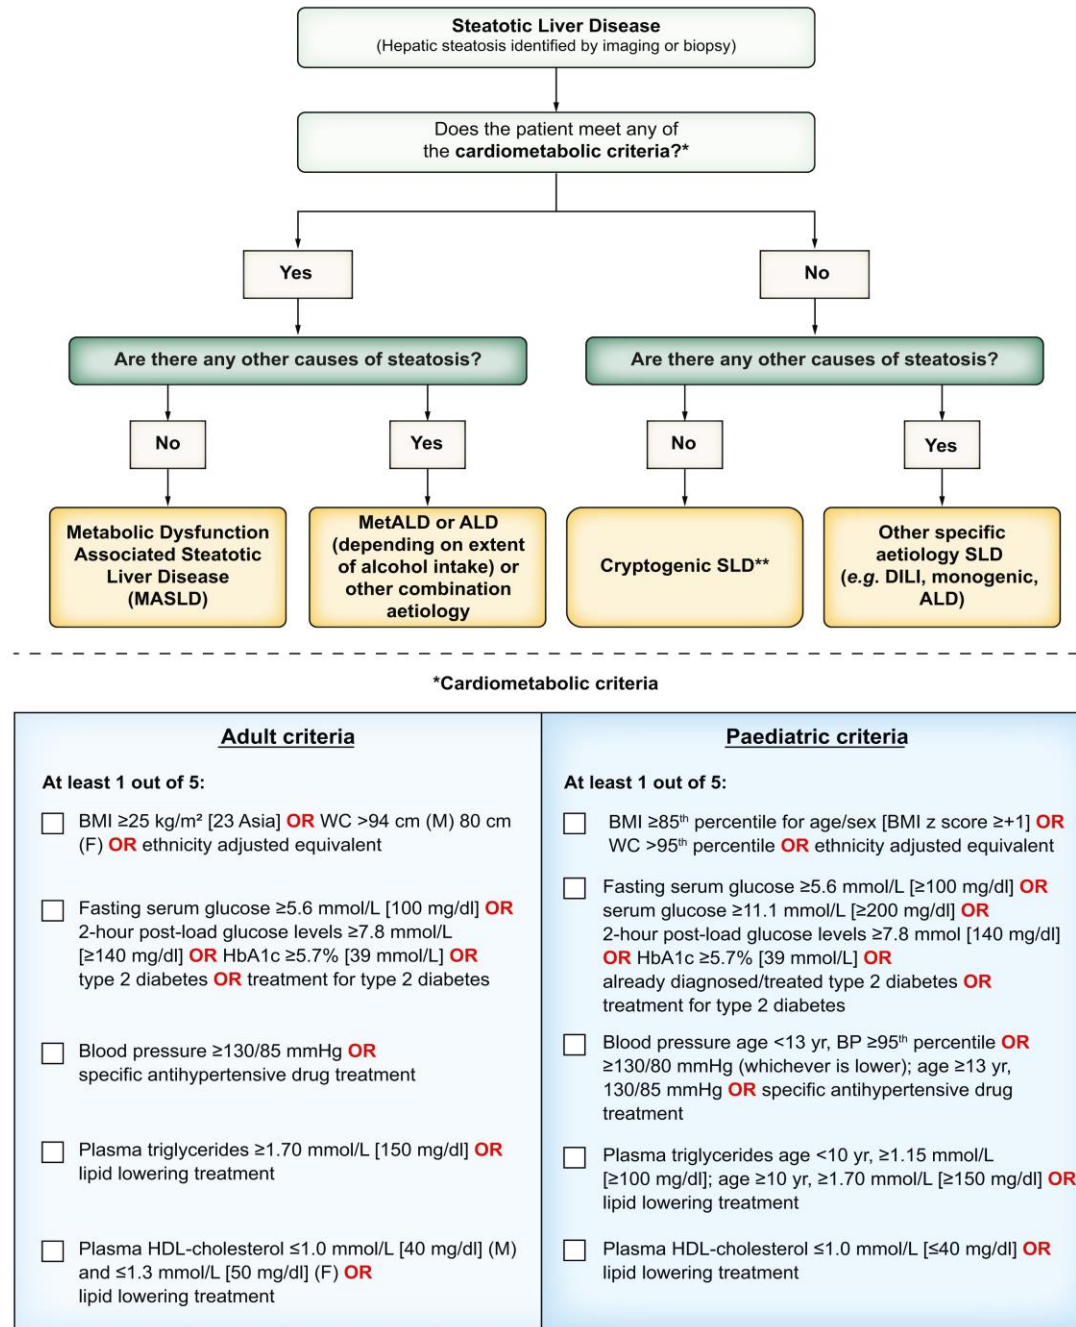

Recommendations for the assessment of metabolic dysfunction-associated fatty liver disease (MAFLD) in primary care: a consensus statement

“MASLD is the presence of excess triglyceride storage in the liver in the presence of at least one cardiometabolic risk factor”

- BMI or waist circumference
- Diabetes or impaired glucose tolerance
- Hypertension
- Elevated triglycerides
- Dyslipidemia

High and rising rates of disease globally

- One in three Australians have MASLD
- Two in three Australians with Type II DM or Obesity have MASLD
- Only 4-5% are aware they have MASLD

Risk factor	Prevalence of MAFLD ^{28,33}
Overweight	30%
Obesity	55%–75%
Type 2 diabetes	55%–60%
Dyslipidaemia	55%
Hypertension	50%
Metabolic syndrome	70%

Natural History of Steatotic Liver Disease and MASLD.

Targher G et al. N Engl J Med 2025;393:683-698

A Time to Cirrhosis or Hepatic Decompensation

B Development and Progression of MASLD

How do patients present?

44 yo male

- Wife suggested “check up”
- Ht 180cm, Wt 90 kg BMI 27.8kg/m²
- BP 125/80 on irbesartan
- ALT 75, AST 40, Alb 44, Bili 12, Platelets 280
- Etoh: 20g x 3nights per week

Clinical History

Abnormal liver function tests

Findings

Moderate increased echogenicity of the liver is consistent with hepatic steatosis. No hepatic lesion. The portal vein is patent with antegrade flow.

Two mobile gallbladder calculi are present, largest 24 mm. The gallbladder is 3 mm in thickness with no tenderness on sono palpation. The common bile duct is 4 mm.

The pancreas is unremarkable. The spleen is mildly enlarged, 13.3 cm. No ascites. No hydronephrosis, renal masses or calculi. Non-aneurysmal abdominal aorta.

How do patients present?

44 yo male

- Wife suggested “check up”
- Ht 180cm, Wt 90 kg BMI 27.8kg/m²
- BP 125/80 on irbesartan
- ALT 75, AST 40, Alb 44, Bili 12, Platelets 280
- Etoh: 20g x 3nights per week

- Etoh: 20g x 3 nights per week

Is this MASLD ?

Clinical History

Abnormal liver function tests

Findings

Moderate increased echogenicity of the liver is consistent with hepatic steatosis. No hepatic lesion. The portal vein is patent with antegrade flow.

Two mobile gallbladder calculi are present, largest 24 mm. The gallbladder is 3 mm in thickness with no tenderness on sono palpation. The common bile duct is 4 mm.

The pancreas is unremarkable. The spleen is mildly enlarged, 13.3 cm. No ascites. No hydronephrosis, renal masses or calculi. Non-aneurysmal abdominal aorta.

Check these!

No requirement for abnormal liver tests

ALT not sensitive as a marker for MASLD

Quite possible to have steatosis,
steatohepatitis and advanced fibrosis with
ALT normal range

(35% MASH, 20% advanced fibrosis, 7%
cirrhosis – Samer et al, Am J Gastro 2019)

Assessing for other causes of steatosis or elevated liver enzymes ... the “liver screen”

- Medications causing steatosis – corticosteroids, amiodarone, valproate, tamoxifen
- Hepatitis C
- Hepatitis B
- Wilson’s disease – low ceruloplasmin, high 24 hour urinary copper
- Coeliac screening
- Iron studies (frequent hyperferritinemia)
- Alpha 1 AT
- Consider immune causes – AIH, PBC, PSC
- (not CMV, EBV)

MASLD without cofactors – what next?

- All practice guidelines recommend a non-invasive assessment of fibrosis
- The presence or absence of fibrosis is the strongest predictor of **liver** related outcomes
- Patients with advanced fibrosis selected for further liver care

European Guidelines 2024

* FIB-4 thresholds valid for age ≤65 years (for age >65 years: lower FIB-4 cut-off is 2.0)

** e.g. lifestyle intervention, treatment of comorbidities (e.g. GLP1RA), bariatric procedures

*** e.g. MRE, SWE, ELF, with adapted thresholds

Ⓐ and Ⓑ are options, depending on medical history, clinical context and local resources

European Guidelines 2024

* FIB-4 thresholds valid for age ≤65 years (for age >65 years: lower FIB-4 cut-off is 2.0)

** e.g. lifestyle intervention, treatment of comorbidities (e.g. GLP1RA), bariatric procedures

*** e.g. MRE, SWE, ELF, with adapted thresholds

Ⓐ and Ⓑ are options, depending on medical history, clinical context and local resources

- 50-70% of patients
- Need a test that will “rule out” advanced fibrosis

- 5-10% of patients
- Need specialised liver assessment

- The grey zone
- 20-40%

* FIB-4 thresholds valid for age ≤65 years (for age >65 years: lower FIB-4 cut-off is 2.0)

** e.g. lifestyle intervention, treatment of comorbidities (e.g. GLP1RA), bariatric procedures

*** e.g. MRE, SWE, ELF, with adapted thresholds

Ⓐ and Ⓑ are options, depending on medical history, clinical context and local resources

Figure 2. Assessment algorithm for a patient presenting with MAFLD

Recommendations for the assessment of metabolic dysfunction-associated fatty liver disease (MAFLD) in primary care: a consensus statement

* Evaluate alcohol intake, medications, risk factors for viral hepatitis, and iron overload.

CKD = chronic kidney disease; CVD = cardiovascular disease; FIB-4 = Fibrosis 4; HbA_{1c} = glycated haemoglobin; MAFLD = metabolic dysfunction-associated fatty liver disease; OSA = obstructive sleep apnoea.

FIB-4

- Uses age, ALT, AST and platelets in calculation to group into low, intermediate and higher risk for advanced fibrosis
- Validated in multiple ethnicities
- Valid even with normal transaminases
- Can be affected by alcohol or ITP
- Inaccurate in those less than 35 years or >65 (uses a higher threshold)
- In a low risk population – rules out advanced fibrosis ~ 97% NPV, PPV ~25%

Fibrosis-4 (FIB-4) Index for Liver Fibrosis

Noninvasive estimate of liver scarring in HCV and HBV patients, to assess need for biopsy.

When to Use ▾	Pearls/Pitfalls ▾	Why Use ▾
Age Use with caution in patients <35 or >65 years old, as the score has been shown to be less reliable in these patients	44	years
AST Aspartate aminotransferase	40	U/L
ALT Alanine aminotransferase	75	U/L
Platelet count	280	$\times 10^3/\mu\text{L}$ ↗

0.73 points

Advanced fibrosis excluded

Approximate fibrosis stage: Ishak 0-1 (Sterling et al 2006)

**Back to our
patient.....**

C

Prognostic utility of Fibrosis-4 Index for risk of subsequent liver and cardiovascular events, and all-cause mortality in individuals with obesity and/or type 2 diabetes: a longitudinal cohort study

- FIB4 can predict future liver related events and overall mortality in MASLD
- Reductions in scores over time can be used to adjust risk

Figure 2. Assessment algorithm for a patient presenting with MAFLD

* Evaluate alcohol intake, medications, risk factors for viral hepatitis, and iron overload.

CKD = chronic kidney disease; CVD = cardiovascular disease; FIB-4 = Fibrosis 4; HbA_{1c} = glycated haemoglobin; MAFLD = metabolic dysfunction-associated fatty liver disease; OSA = obstructive sleep apnoea.

Liver Clinic

- Confirm or refute advanced fibrosis
 - Fibroscan (+/- biopsy)
 - Confirm no other diagnosis (alcohol)
 - Consider whether CSPH (Clinically Significant Portal Hypertension)
 - Consider the role of HCC surveillance
 - Consider suitability for clinical trials
 - Management of decompensation
-
- Hospital based risk factor management – Tertiary Obesity Management Service, Statewide Bariatric Service, Mood and Food Program, QUT Partnership Program (Type II DM)
 - No personalised dietetic service for weight loss
 - Low risk patients returned for holistic risk factor management in primary care

Figure 2. Assessment algorithm for a patient presenting with MAFLD

* Evaluate alcohol intake, medications, risk factors for viral hepatitis, and iron overload.

CKD = chronic kidney disease; CVD = cardiovascular disease; FIB-4 = Fibrosis 4; HbA_{1c} = glycated haemoglobin; MAFLD = metabolic dysfunction-associated fatty liver disease; OSA = obstructive sleep apnoea.

What about the grey zone? About 1/3 of patients

- Need another test
 - Elastography
 - Serum test
 - (repeat FIB4 after intensive risk factor management)
 - Or hepatology assessment

Elastography

- Measures the “stiffness” of liver tissue, correlates with fibrosis – A sonic palpation
- Can be artificially elevated by inflammation, alcoholic hepatitis, recent food, heart failure or cholestasis
- Transient elastography = Fibroscan – used in clinics
- Shear wave elastography – usually available in radiology facilities
- Inter operator variability – the challenges of knowing the local services
- Readings difficult to acquire with abdominal adiposity – failure rate 10-30%
- No medicare rebate

Elastography

Biomarkers

New noninvasive biomarkers of liver fibrosis the (2017) Enhanced Liver Fibrosis score (ELF score)

Hyaluronic acid (HA)

Procollagen III amino
terminal peptide
(PIIINP)

Tissue inhibitor of
metalloproteinase 1
(TIMP-1)

Run as automated immunoassays using a serum sample

$$\text{ELF Score}^T = 2.278 + 0.851 \ln (C_{\text{HA}}) + 0.751 \ln (C_{\text{PIIINP}}) + 0.394 \ln (C_{\text{TIMP-1}})$$

< 7.7: no to mild fibrosis

≥ 7.7 — < 9.8: Moderate fibrosis

≥ 9.8 — < 11.3: Severe fibrosis

≥ 11.3: Cirrhosis

There is still a grey zone!

No medicare rebate

Current cost \$233 S+N

Request as “Serum Liver
Fibrosis Markers”

ELF score has similar accuracy to elastography

Studied in various biopsied CLD
Tomaki et al, Diagnostics 2022

Study in biopsied MASLD
Younossi et al, JAMA 2021

Figure 2. Assessment algorithm for a patient presenting with MAFLD

* Evaluate alcohol intake, medications, risk factors for viral hepatitis, and iron overload.

CKD = chronic kidney disease; CVD = cardiovascular disease; FIB-4 = Fibrosis 4; HbA_{1c} = glycated haemoglobin; MAFLD = metabolic dysfunction-associated fatty liver disease; OSA = obstructive sleep apnoea.

OK, so we have diagnosed MASLD and staged the fibrosis. What next?

- This is a multisystem disease
- Treatment revolves around managing all of the risk factors especially the insulin resistance and cardiovascular risks

Approximate increase in the risk of new-onset adverse clinical outcomes
Type 2 diabetes (if no type 2 diabetes at baseline) — 2.2×
Fatal or nonfatal cardiovascular disease — 1.5×
Heart failure — 1.5×
Atrial fibrillation — 1.2×
CKD (stage ≥3) — 1.5×
Extrahepatic cancers — 1.5×
Cirrhosis or HCC — 2–10×

Positive lifestyle modification

Exercise

- Reduces liver fat content
- Reduces ALT
- Improves liver stiffness
- Reduces insulin resistance
- Improves dyslipidemia
- Improves adiponectin levels
- Improves sarcopenia
- Improvements can occur independent of weight loss, but are heightened by weight loss

- Psychological benefits
- Cardiovascular benefits
- Social engagement
- Sleep benefits

Positive lifestyle modification

Exercise

- Reduces liver fat content
- Reduces ALT
- Improves liver stiffness
- Reduces insulin resistance
- Improves dyslipidemia
- Improves adiponectin levels
- Improves sarcopenia
- Improvements can occur independent of weight loss, but are heightened by weight loss

- Psychological benefits
- Cardiovascular benefits
- Social engagement
- Sleep benefits

Continued adherence is more important than exercise type – ideally a combination of aerobic and resistance training

Positive lifestyle modification

Weight reduction

- Clear evidence of benefit from high quality clinical trials
- 5% body weight reduction reduces liver fat
- 7-10% body weight reduction reduces liver inflammation
- >10 % body weight reduction improves fibrosis scores

Studies with follow up out to 24 months tend to show regain and partial deterioration of liver lipid and stiffness scores after lifestyle intervention

Positive lifestyle modification

Dietary intervention

- No clear difference in liver results between low fat vs low carb vs intermittent fasting
- Mediterranean-style diet consistently shows liver and CVS benefits even without weight loss
- Positive association with MASLD and sweet beverages
- Positive association with ultra-processed foods
- Protective effect of coffee consumption

Positive lifestyle modification

Alcohol

- Recommend abstinence from alcohol in cirrhosis
- In noncirrhotic MASLD, hard to recommend any safe level of consumption
- Moderate levels of consumption associated with up to twice the rate of progression in observational studies
- Discuss risks and recommend consumption as low as possible

Pharmacological interventions

Until recently, little evidence for any liver specific pharmacological interventions

- Resmetirom US TGA approved 2024
- Increasing data for GLP1
- Fibroblast growth factor 21 analogues in clinical trials

A Phase 3, Randomized, Controlled Trial of Resmetirom in NASH with Liver Fibrosis

S.A. Harrison, P. Bedossa, C.D. Guy, J.M. Schattenberg, R. Loomba, R. Taub, D. Labriola, S.E. Moussa, G.W. Neff, M.E. Rinella, Q.M. Anstee, M.F. Abdelmalek, Z. Younossi, S.J. Baum, S. Francque, M.R. Charlton, P.N. Newsome, N. Lanthier, I. Schiefke, A. Mangia, J.M. Pericàs, R. Patil, A.J. Sanyal, M. Nouredin, M.B. Bansal, N. Alkhouri, L. Castera, M. Rudraraju, and V. Ratziu, for the MAESTRO-NASH Investigators*

- Oral, liver directed, thyroid hormone receptor agonist
- Thyroid hormone in the liver reduces lipogenesis, increases lipophagy and reduces fibrogenesis
- Included F1-F3 patients
- Week 52 data published, trial continues to 5 year
- Improvements in liver fat, fibrosis, LDL
- Side effects diarrhoea, nausea, pruritis

GLP1 agonists

- Improved histology in MASH studies involving semaglutide and tirzepatide (RCT)
- Real world cohort studies show reduction in cirrhosis diagnosis and lower risk of HCC
- Newer agents in the pipeline
- TGA approval is for management of overweight and obesity with comorbidities

A GLP-1 Receptor Agonist: Semaglutide for 72 Weeks

B GLP-1–GIP Receptor Agonist: Tirzepatide for 52 Weeks

C GLP-1–Glucagon Receptor Agonist: Survodutide for 48 Weeks

D GLP-1–GIP–Glucagon Receptor Agonist: Retatrutide for 48 Weeks

Fibroblast Growth Factor 21 analogues

- Still in clinical trial stage
- Targeting hepatic lipid metabolism, insulin sensitivity
- May reduce fibrosis stage in F2-3

Clinical Trial > [Lancet Gastroenterol Hepatol](#). 2023 Dec;8(12):1080-1093.

doi: 10.1016/S2468-1253(23)00272-8. Epub 2023 Oct 3.

Safety and efficacy of once-weekly efruxifermin versus placebo in non-alcoholic steatohepatitis (HARMONY): a multicentre, randomised, double-blind, placebo-controlled, phase 2b trial

Stephen A Harrison ¹, Juan P Frias ², Guy Neff ³, Gary A Abrams ⁴, K Jean Lucas ⁵, William Sanchez ⁶, Sudhanshu Gogia ⁷, Muhammed Y Sheikh ⁸, Cynthia Behling ⁹, Pierre Bedossa ¹⁰, Lan Shao ¹¹, Doreen Chan ¹², Erica Fong ¹², Brittany de Temple ¹², Reshma Shringarpure ¹³, Erik J Tillman ¹², Timothy Rolph ¹², Andrew Cheng ¹², Kitty Yale ¹²; HARMONY Study Group

Pharmacological interventions

Treating the
comorbidities in MASLD

- Obesity
- Type II DM
- Dyslipidemia

Type II DM

- SGLT2-inhibitors have hepatoprotective effects in Type II DM
- Meta-analysis of cohort studies reassuring
- One RCT assessing histological end points at 48 weeks showing improvements

Sodium–Glucose Cotransporter 2 Inhibitor Use and Risk of Liver-Related Events in Patients With Type 2 Diabetes: A Meta-analysis of Observational Cohort Studies

Alessandro Mantovani, Riccardo Morandin, Maria Giovanna Lando, Veronica Fiorio, Grazia Pennisi, Salvatore Petta, Norbert Stefan, Herbert Tilg, Christopher D. Byrne, and Giovanni Targher

Diabetes Care 2025;48(6):1042–1052 | <https://doi.org/10.2337/dc25-0282>

SGLT2 Inhibitor Use and Liver-Related Events: A Meta-analysis

Methods:

- Eight cohort studies
- n=626,104 with T2DM

n=228,298 SGLT2 inhibitor new users

n=397,806 other DM medication new users

Outcomes: SGLT2 Inhibitors vs. Other Diabetes Medication

Major Adverse Liver Outcomes

HR 0.83
(95% CI 0.72-0.95)

Liver-Related Death

HR 0.64
(95% CI 0.50-0.82)

Conclusions: SGLT2 inhibitor use was associated with significant risk reduction in major adverse liver outcomes in comparison with use of DPP-4 inhibitors, metformin, or pioglitazone but not GLP-1 receptor agonists.

DM, diabetes mellitus; DPP-4, dipeptidyl peptidase 4; GLP-1, glucagon-like peptide 1; HR, hazard ratio; SGLT2, sodium-glucose cotransporter 2.

Randomized Controlled Trial > *BMJ*. 2025 Jun 4;389:e083735. doi: 10.1136/bmj-2024-083735.

Effect of dapagliflozin on metabolic dysfunction-associated steatohepatitis: multicentre, double blind, randomised, placebo controlled trial

Jiayang Lin^{1 2 3 4}, Yan Huang^{5 3 4}, Bingyan Xu^{1 2 3 4}, Xuejiang Gu⁶, Junlin Huang^{1 2 3 4}, Jia Sun⁷, Lijing Jia⁸, Jiang He^{9 10}, Chensihan Huang^{1 2 3 4}, Xueyun Wei^{1 2 3 4}, Jinjun Chen¹¹, Xiaomin Chen¹², Jingping Zhou¹³, Lixian Wu¹⁴, Peizhen Zhang^{15 2 3 4}, Yaxin Zhu⁸, Huimin Xia⁶, Ge Wen¹⁶, Yating Liu^{1 2 3 4}, Shiqun Liu¹, Yanmei Zeng¹, Lin Zhou¹, Hongxia Jia¹, Hua He¹⁷, Yaoming Xue¹, Fenglin Wu¹, Huijie Zhang^{15 2 5 3 4}

Metformin

- Weight neutral
- No high quality evidence that improves MASLD histology but may be useful
- No indication for discontinuation unless decompensation or renal failure

Dyslipidemia – Statins are safe

- No increased risk of hepatotoxicity in MASLD
- Undertreatment is frequent, vascular disease is the commonest cause of death in those without advanced fibrosis
- Observational studies suggest benefits in liver outcomes but no RCT with histological end points

Chalasani et al, Gastro 2004

El-Serag et al Gastro 2009

Blais et al, Dig Dis Sci 2016

Surgical Interventions

- Bariatric surgery (when indicated) can be associated with long term improvements in MASLD histology
- Prospective (non RCT) studies show improved liver outcomes
- Beware of established cirrhosis and alcohol risks

Resolution of NASH according to weight loss

Evolution of Fibrosis after Bariatric Surgery

*single centre, patients with severe obesity

Lassalilly et al, Gastro 2020

A Major adverse liver outcomes^a

No. at risk						
Nonsurgical control	508	422	376	283	211	146
Bariatric surgery	650	525	463	381	252	153

B Major adverse cardiovascular events^b

No. at risk						
Nonsurgical control	508	417	370	270	202	136
Bariatric surgery	650	523	455	365	234	141

*baseline MASH F1-3, non randomised
Aminean et al, JAMA 2021

Hepatocellular Carcinoma

- Rapidly increasing in incidence, 5 year survival low
- Cirrhotic patients should be in a surveillance program unless not appropriate for age and stage
- Non-cirrhotic HCC is “a thing” especially in older, diabetic males
- Incidence doesn't warrant surveillance, but lesions should be investigated (multiphase CT or MRI)
- Normal AFP doesn't rule out malignancy

Figure 1: Hepatocellular carcinomas cases diagnosed and incidence rates
Persons, All ages, 2001 to 2020

Figure 1 provides the number of cases and rates for the selected cancer

■ Number of new cases ■ Rate

Summary

- MASLD is the liver manifestation of the metabolic syndrome and reflects a multisystem disease
- Common and becoming more common
- Assess for other causes of liver dysfunction and address these
- Assess fibrosis stage to risk stratify – FIB4 +/- other tests
- Manage the risk factors – physical activity, diet quality, weight, insulin resistance, dyslipidemia, smoking
- Liver specific treatments are coming but patients need multisystem care
- General Practice is vital for the holistic risk factor management, preventative care needed for this condition
- Who to refer?

Summary

- MASLD is the liver manifestation of the metabolic syndrome and reflects a multisystem disease
- Common and becoming more common
- Assess for other causes of liver dysfunction and address these
- Assess fibrosis stage to risk stratify – FIB4 +/- other tests
- Manage the risk factors – physical activity, diet quality, weight, insulin resistance, dyslipidemia, smoking
- Liver specific treatments are coming but patients need multisystem care
- General Practice is vital for the holistic risk factor management, preventative care needed for this condition
- Who to refer?
 - **Uncertainty re diagnosis**
 - **Uncertainty re fibrosis stage**
 - **Advanced fibrosis**

Information about

Fatty Liver Disease

What is fatty liver disease?

"Fatty liver disease" is a condition where fat builds up in the liver. When too much fat is stored in the liver, it can lead to liver scarring, or "cirrhosis". Fatty liver is very common and affects about a third of Australian adults.

What are the symptoms?

Most people don't have any symptoms. Fatty liver sometimes causes abdominal (belly) pain and fatigue (tiredness), but this is rare. It doesn't cause nausea or intolerance to fatty foods.

Why does fatty liver need treatment?

Shutterstock | Shutterstock.com

What is MAFLD?

Metabolic (dysfunction)-associated fatty liver disease (MAFLD), which used to be known as non-alcoholic fatty liver disease (NAFLD), is the most common form of fatty liver disease. It can range in severity from mild, with no inflammation (damage), to severe, with inflammation in the liver (known as "steatohepatitis").

Background

[About fatty liver](#)

Assessment

1. Consider fatty liver in a patient with an incidental finding of non-specific elevated liver enzymes or hepatic steatosis on ultrasound.
2. Take a history:
 - Check for [signs and symptoms of liver disease](#).
 - Consider risk factors for metabolic dysfunction-associated fatty liver disease (MAFLD) and related co-morbidities.
 - Assess [alcohol consumption](#) and other lifestyle factors e.g., physical activity, smoking, diet.
 - People with obesity and MAFLD should be assessed in accordance with the [Australian Obesity Management Algorithm](#).
3. Examination:
 - Check vital signs.
 - Measure height and weight and [calculate BMI](#).
 - Check abdomen for:
 - hepatomegaly (reflecting chronic liver disease)
 - a hard, irregular liver outline (reflecting cirrhosis)
 - splenomegaly or ascites (reflecting portal hypertension)
 - masses (reflecting hepatocellular carcinoma (HCC))
 - tenderness (suggestive of pathology other than MAFLD)
 - Examine for [signs of severe liver disease](#).
4. Investigation:
 - Arrange [baseline investigations](#).
 - Arrange [further investigations](#) if indicated to exclude other causes of liver disease e.g., hepatitis B (HBV), hepatitis C (HCV), haemochromatosis, autoimmune liver disease. See also [Abnormal Liver Function Tests](#).
5. Diagnose MAFLD – presence of hepatic steatosis (with ultrasound the first line test to diagnose steatosis) plus with one of the following:
 - Overweight or obesity (defined as BMI $\geq 25\text{kg/m}^2$ in Caucasians, or BMI $\geq 23\text{kg/m}^2$ in Asians)
 - Type 2 diabetes
 - Lean/normal weight with the presence of at least 2 [metabolic risk abnormalities](#).

Queensland Government Smart Referrals

Dr Fred Findacure

Patient name: Nicole METRONORTH DoB: 29 Sep 1977

Request information

Request date: 21 Oct 2025

Request type: **New referral** | Update | Continuation | Request for advice

Reason for referral: ☒ New condition requiring specialist consultation
☐ Deterioration in condition, recently discharged from outpatients < 12 months
☐ Other

Priority: **Urgent** | **Routine**

Provider: **QHSR** | Private

Consents

Date patient consented to request: 21 Oct 2025

Patient is willing to have surgery if required? ☐ Yes ☐ No ☐ Not applicable

Condition and Specialty: Gastroenterology - Metabolic-Associated Fatty Liver Disease (M) [HealthPathways](#)

Suitable for Telehealth? ☐ Yes ☐ No

Are you the patient's usual GP? ☐ Yes ☐ No

Request recipient

Service/Location: Please select

Specialist name:

Organisation details:

Hepatology	ROYAL BRISBANE & WOMEN'S HOSPITAL	6.4 km	
Hepatology	THE PRINCE CHARLES HOSPITAL	12.2 km	+
Hepatology	REDCLIFFE HOSPITAL	31.5 km	+
Hepatology	PRINCESS ALEXANDRA HOSPITAL	1.8 km	Out of catchment +

Metabolic Dysfunction-Associated Fatty Liver Disease (MAFLD) also MASLD, formerly NAFLD

Emergency department referrals

All urgent cases must be discussed with the on call Registrar to obtain appropriate prioritisation and treatment. Contact through:

- Royal Brisbane and Women's Hospital (07) 3646 8111
- The Prince Charles Hospital (07) 3139 4000
- Redcliffe Hospital (07) 3883 7777
- Caboolture Hospital (07) 5433 8888

Urgent cases accepted via phone must be accompanied with a written referral and a copy faxed immediately to the Central Patient Intake Unit: 1300 364 952.

Potentially life-threatening symptoms suggestive of:

- Acute severe GI bleeding
- Acute liver failure: (acutely abnormal liver blood tests in absence of cirrhosis, associated with development of coagulopathy and hepatic encephalopathy)
- Sepsis in a patient with cirrhosis
- Severe encephalopathy in a patient with liver disease
- New significant renal dysfunction in a patient with cirrhosis

Does your patient wish to be referred?

Minimum referral criteria

Does your patient meet the minimum referral criteria?

Category 1

Appointment within 30 days is desirable

MAFLD with concerning features

- Evidence of liver decompensation (e.g. jaundice and/or ascites and/or encephalopathy)

Other Hepatology conditions
